

pandas.DataFrame.median

[Show Source](#)**DataFrame.median(axis=0, skipna=True, numeric_only=False, **kwargs)**[\[source\]](#)

Return the median of the values over the requested axis.

Parameters: `axis : {index (0), columns (1)}`

Axis for the function to be applied on. For Series this parameter is unused and defaults to 0.

For DataFrames, specifying `axis=None` will apply the aggregation across both axes.

New in version 2.0.0.

skipna : bool, default True

Exclude NA/null values when computing the result.

numeric_only : bool, default False

Include only float, int, boolean columns. Not implemented for Series.

****kwargs**

Additional keyword arguments to be passed to the function.

Returns: Series or scalar

Examples

```
>>> s = pd.Series([1, 2, 3])
>>> s.median()
2.0
```

[\[>>>\]](#)

With a DataFrame

```
>>> df = pd.DataFrame({'a': [1, 2], 'b': [2, 3]}, index=['tiger', 'zebra'])
>>> df
   a   b
tiger  1  2
zebra  2  3
>>> df.median()
a    1.5
b    2.5
dtype: float64
```

[\[>>>\]](#)

Using axis=1

```
>>> df.median(axis=1)
tiger    1.5
zebra    2.5
dtype: float64
```

[\[>>>\]](#)

In this case, `numeric_only` should be set to `True` to avoid getting an error.

```
>>> df = pd.DataFrame({'a': [1, 2], 'b': ['T', 'Z']},
...                      index=['tiger', 'zebra'])
>>> df.median(numeric_only=True)
a    1.5
dtype: float64
```
